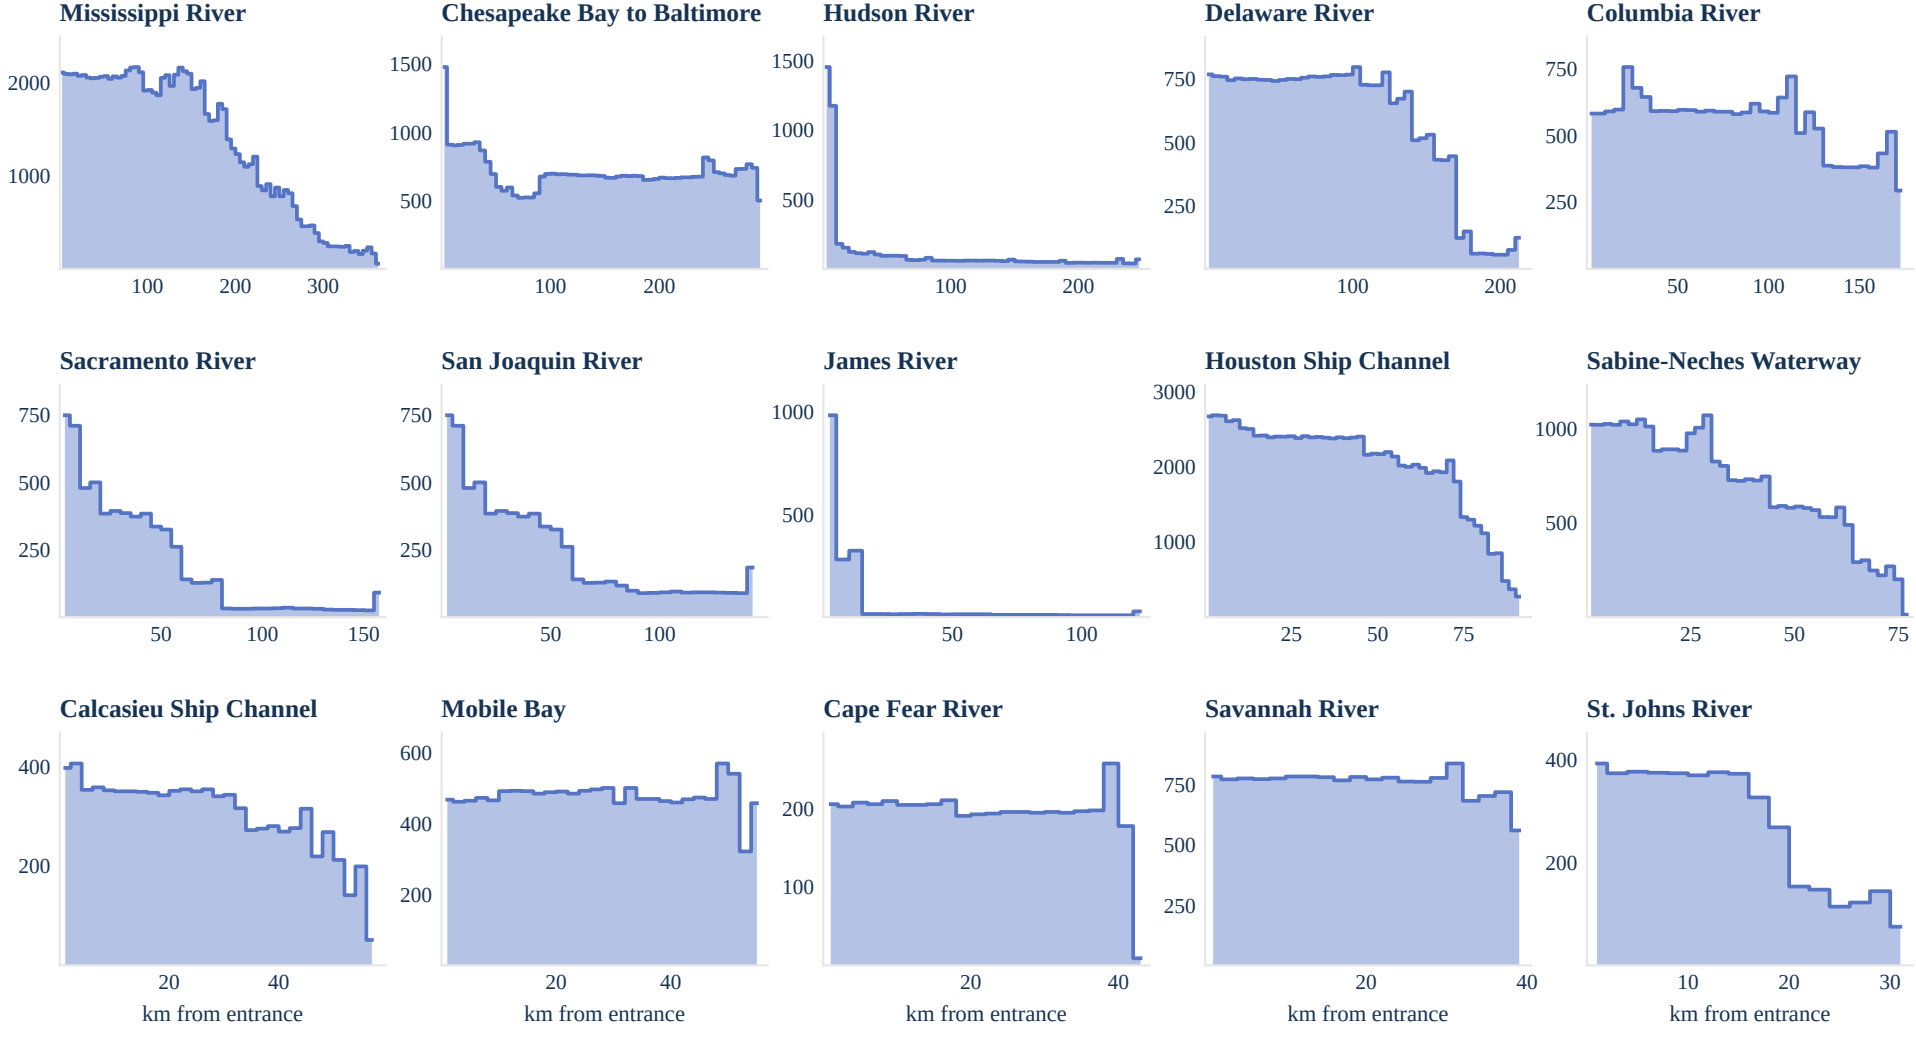
DRAFT//PRE-DECISIONAL

Large-ship traffic falls off step by step as each river or channel passes its ports

Distinct large ships (vertical axis) in each reach of each corridor (2 km reaches under 120 km long, 5 km otherwise), 2024 and 2025 together; each panel has its own scale



Source: NTIA analysis of MarineCadastre AIS, 104 sampled days in 2024 and 2025; large ships = cargo, tanker, passenger, military, and other seagoing ships 100 m or longer, plus tug-barges near the coast. Distance is measured along the large-ship route cells from the entrance.
